Jamin

Sell BCH or PUSD for cash. A contract, not a middleman, holds the coins.

BCH BLAZE 2026, Best SolidCash Application

Muhammad Aiman, Malaysia. Solo build.

Jamin

Press Release on mainnet at jamin.sasateguh.com to release a waiting demo escrow on Bitcoin Cash mainnet, signed in your browser, or Try the simulator to play every branch on the SolidCash mock network.

On mainnet so far: 13 escrows, 0.00162006 BCH and 0.23 PUSD locked in them, and 2 calls refused by the network.

`github.com/aimanmalib/jamin`

Try it in a minute

1. Open jamin.sasateguh.com and choose Try it. The compiled contracts run on the SolidCash mock network in your browser.
2. Play seller, buyer, arbitrator or an outsider through release, buyer cancel, seller cancel and dispute. Each step shows the transaction or the contract's named error.
3. Let one panel member decide a dispute alone. The contract refuses until a second member signs.
4. Switch the seller to the demo wallet, or open the Wallet tab and sell from your own wallet over WizardConnect. The page is in English and Bahasa Melayu.

The Story of Jamin

- In a peer-to-peer trade one side has to send first, or both trust an exchange that holds the coins.
- OpenPeer answered this on EVM with an MIT-licensed escrow contract. Jamin ports it to the Bitcoin Cash UTXO model in SolidCash.
- Each escrow is a stateful contract: its state lives in the coin, and covenant rules fix every payout.
- Building it turned up fourteen SolidCash issues. Four fixes are open as pull requests: #8, #9, #10 and #15. recorded

Benefits of Jamin

- Nobody holds the coins in the middle. Every payout is a covenant output, so whoever builds the transaction cannot redirect it.
- A dispute costs a fee from the side that opens it, and two of three named arbitrators decide it (checkMultiSig).
- The seller can cancel only after the waiting time and only while the buyer has not marked the trade paid.
- The same rules hold for BCH and for CashTokens such as PUSD.
- 103 SolidHat tests in 12 files. Removing a check from a copy of a contract makes its named test fail. measured

BCH Usage

- Five branches on a stock Bitcoin Cash Node 29.0.0 regtest node: 20 transactions mined, largest unlocking script 6,888 of 10,000 bytes. measured
- Mainnet, from the project's test wallet: release, buyer cancel, seller cancel, a dispute decided by two of three panel members and a wallet seller, 20 transactions. measured
- A PUSD escrow on mainnet: 12 units bought from Cauldron pools, 10 released to the buyer and 1 paid as the fee. measured
- Cashonize v0.15.2, a third-party wallet, signed the seller's creation, deposit and release of a mainnet escrow over WizardConnect. measured
- The network refused an early seller cancel and a release signed by the buyer. measured

The Vision for Jamin

- Trade from phone wallets on the Wallet tab, with a person approving each request.
- Spend the coins each escrow leaves at its contract addresses, so a finished trade returns everything.
- A refund to the seller that anyone can trigger after a long deadline, so coins never stay locked.
- A signed payment reference from the buyer that the arbitrators can check in a dispute.

Thank you
